

HIGHLIGHTS OF PRESCRIBING INFORMATION

These highlights do not include all the information needed to use LEQEMBI® safely and effectively. See full prescribing information for LEQEMBI®.

LEQEMBI® (lecanemab-irmb) injection, for intravenous or subcutaneous use

Initial U.S. Approval: 2023

WARNING: AMYLOID RELATED IMAGING ABNORMALITIES *See full prescribing information for complete boxed warning.*

Monoclonal antibodies directed against aggregated forms of beta amyloid, including LEQEMBI, can cause amyloid related imaging abnormalities (ARIA), as ARIA with edema (ARIA-E) and ARIA with hemosiderin deposition (ARIA-H). ARIA is usually asymptomatic, although serious and life-threatening events can occur. ARIA can be fatal. Serious intracerebral hemorrhages > 1 cm have occurred in patients treated with this class of medications. ARIA-E can cause focal neurologic deficits that can mimic ischemic stroke. (5.1, 6.1)

ApoE ε4 Homozygotes

Patients treated with this class of medications, including LEQEMBI, who are ApoE ε4 homozygotes have a higher incidence of ARIA, including symptomatic and serious ARIA, compared to heterozygotes and noncarriers. Testing for ApoE ε4 status should be performed prior to initiation of treatment to inform the risk of developing ARIA. Prior to testing, the risk of ARIA across genotypes and implications of genetic testing results should be discussed with patients. (5.1)

Consider the benefit for the treatment of Alzheimer's disease and risk of ARIA when deciding to treat with LEQEMBI. (5.1, 14)

RECENT MAJOR CHANGES

Boxed Warning	1/2025
Dosage and Administration (2.2, 2.3, 2.4, 2.5, 2.6, 2.7)	8/2025
Contraindications (4)	8/2025
Warnings and Precautions (5.1)	12/2025
Warnings and Precautions (5.2, 5.3)	8/2025

INDICATIONS AND USAGE

LEQEMBI is an amyloid beta-directed antibody indicated for the treatment of Alzheimer's disease. Treatment with LEQEMBI should be initiated in patients with mild cognitive impairment or mild dementia stage of disease, the population in which treatment was initiated in clinical trials. (1)

DOSAGE AND ADMINISTRATION

- Confirm the presence of amyloid beta pathology prior to initiating treatment. (2.1)
- Obtain a recent baseline brain MRI prior to initiating treatment. (2.4, 5.1)
- Obtain an MRI within approximately one week prior to the 3rd, 5th, 7th, and 14th infusions. If radiographically observed ARIA occurs, treatment recommendations are based on type, severity, and presence of symptoms. (2.4, 5.1)

- Recommended starting dosage: 10 mg/kg once every 2 weeks administered after dilution as an intravenous infusion over approximately one hour. (2.2)
- After 18 months, continue treatment once every 2 weeks or transition to an intravenous or subcutaneous maintenance dosage. (2.2)
- Recommended maintenance dosage:
 - Intravenous infusion: 10 mg/kg once every 4 weeks (2.2, 2.5)
 - Subcutaneous injection: 360 mg administered once a week using the LEQEMBI IQLIK autoinjector (2.2, 2.6).
- See Full Prescribing Information for preparation and administration instructions. (2.5, 2.6)

DOSAGE FORMS AND STRENGTHS

Intravenous Infusion

- Injection: 500 mg/5 mL (100 mg/mL) solution in a single-dose vial (3)
- Injection: 200 mg/2 mL (100 mg/mL) solution in a single-dose vial (3)

Subcutaneous Injection

- Injection: 360 mg/1.8 mL (200 mg/mL) in a single-dose prefilled IQLIK autoinjector (3)

CONTRAINDICATIONS

LEQEMBI is contraindicated in patients with serious hypersensitivity to lecanemab-irmb or to any of the excipients of LEQEMBI or LEQEMBI IQLIK. (4)

WARNINGS AND PRECAUTIONS

- Amyloid Related Imaging Abnormalities (ARIA): Enhanced clinical vigilance for ARIA is recommended during the first 14 weeks of treatment with LEQEMBI. Risk of ARIA, including symptomatic ARIA, was increased in apolipoprotein E ε4 homozygotes compared to heterozygotes and noncarriers. The risk of ARIA-E and ARIA-H is increased in patients with pretreatment microhemorrhages and/or superficial siderosis. If a patient experiences symptoms suggestive of ARIA, clinical evaluation should be performed, including MRI scanning if indicated. (2.4, 5.1)
- Infusion-Related Reactions: The infusion rate may be reduced, or the infusion may be discontinued, and appropriate therapy administered as clinically indicated. Consider pre-medication at subsequent dosing with antihistamines, non-steroidal anti-inflammatory drugs, or corticosteroids. (5.3)

ADVERSE REACTIONS

Most common adverse reactions (at approximately 10% and higher incidence compared to placebo): infusion-related reactions, amyloid related imaging abnormality-microhemorrhages, amyloid related imaging abnormality-edema/effusion, and headache. (6.1)

To report SUSPECTED ADVERSE REACTIONS, contact Eisai Inc. at 1-888-274-2378 or FDA at 1-800-FDA-1088 or www.fda.gov/medwatch.

See 17 for PATIENT COUNSELING INFORMATION and Medication Guide.

FULL PRESCRIBING INFORMATION

WARNING: AMYLOID RELATED IMAGING ABNORMALITIES

Monoclonal antibodies directed against aggregated forms of beta amyloid, including LEQEMBI, can cause amyloid related imaging abnormalities (ARIA), characterized as ARIA with edema (ARIA-E) and ARIA with hemosiderin deposition (ARIA-H). Incidence and timing of ARIA vary among treatments. ARIA usually occurs early in treatment and is usually asymptomatic, although serious and life-threatening events can occur. ARIA can be fatal. Serious intracerebral hemorrhages > 1 cm, some of which have been fatal, have been observed in patients treated with this class of medications. Because ARIA-E can cause focal neurologic deficits that can mimic an ischemic stroke, treating clinicians should consider whether such symptoms could be due to ARIA-E before giving thrombolytic therapy to a patient being treated with LEQEMBI [see *Warnings and Precautions (5.1)*, *Adverse Reactions (6.1)*].

ApoE ε4 Homozygotes

Patients who are apolipoprotein E ε4 (ApoE ε4) homozygotes (approximately 15% of Alzheimer's disease patients) treated with this class of medications, including LEQEMBI, have a higher incidence of ARIA, including symptomatic, serious, and severe radiographic ARIA, compared to heterozygotes and noncarriers. Testing for ApoE ε4 status should be performed prior to initiation of treatment to inform the risk of developing ARIA. Prior to testing, prescribers should discuss with patients the risk of ARIA across genotypes and the implications of genetic testing results. Prescribers should inform patients that if genotype testing is not performed they can still be treated with LEQEMBI; however, it cannot be determined if they are ApoE ε4 homozygotes and at higher risk for ARIA [see *Warnings and Precautions (5.1)*].

Consider the benefit of LEQEMBI for the treatment of Alzheimer's disease and potential risk of serious adverse events associated with ARIA when deciding to initiate treatment with LEQEMBI [see *Warnings and Precautions (5.1)* and *Clinical Studies (14)*].

1 INDICATIONS AND USAGE

LEQEMBI is indicated for the treatment of Alzheimer's disease. Treatment with LEQEMBI should be initiated in patients with mild cognitive impairment or mild dementia stage of disease, the population in which treatment was initiated in clinical trials.

2 DOSAGE AND ADMINISTRATION

2.1 Patient Selection

Confirm the presence of amyloid beta pathology prior to initiating treatment [see *Clinical Pharmacology (12.1)*].

2.2 Recommended Dosage

Initiate LEQEMBI as an intravenous infusion using the starting dosage (see Table 1). After 18 months, the starting dosage may be continued or a transition to maintenance dosage regimen may be considered, which can be administered by either intravenous infusion or subcutaneous injection (see Table 1). If transitioning from

starting dosage to a maintenance dosage regimen, administer the first maintenance dose two weeks after the last starting dose.

Table 1: Starting and Maintenance Dosage Regimens

Route of Administration	Dose	Frequency	Infusion Rate (if Intravenous)
Starting Dosage			
Intravenous Only (LEQEMBI)	10 mg/kg	Once every 2 weeks	Over approximately one hour
Maintenance Dosage			
Intravenous (LEQEMBI)	10 mg/kg	Once every 4 weeks	Over approximately one hour
Subcutaneous (LEQEMBI IQLIK)	360 mg	Once every week	-----

For intravenous infusion, use LEQEMBI vials. LEQEMBI vials must be diluted before administration [see *Dosage and Administration (2.5)*].

For subcutaneous administration, use LEQEMBI IQLIK [see *Dosage and Administration (2.6)*].

2.3 Switching Between Maintenance Dosage Regimens

During maintenance dosage regimen, patients may switch the route of administration (intravenous LEQEMBI or subcutaneous LEQEMBI IQLIK). This transition should be initiated at 1 week following the last maintenance dose of either the intravenous or subcutaneous dosing regimen. Thereafter, follow the dosing schedule for the newly assigned maintenance dosage regimen.

2.4 Monitoring and Dosing Interruption for Amyloid Related Imaging Abnormalities

LEQEMBI can cause amyloid related imaging abnormalities -edema (ARIA-E) and -hemosiderin deposition (ARIA-H) [see *Warnings and Precautions (5.1)*].

Monitoring for ARIA

Obtain a recent baseline brain magnetic resonance imaging (MRI) prior to initiating treatment with LEQEMBI. Obtain an MRI prior to the 3rd, 5th, 7th, and 14th infusions. In general, the MRI should be performed within approximately one week before the scheduled infusion of LEQEMBI and reviewed prior to proceeding with the infusion. If a patient experiences symptoms suggestive of ARIA, clinical evaluation should be performed, including an MRI if indicated.

Recommendations for Dosing Interruptions in Patients with ARIA

ARIA-E

The recommendations for dosing interruptions for patients with ARIA-E are provided in Table 2.

Table 2: Dosing Recommendations for Patients with ARIA-E

Clinical Symptom Severity ¹	ARIA-E Severity on MRI ²		
	Mild	Moderate	Severe
Asymptomatic	May continue dosing	Suspend dosing ³	Suspend dosing ³
Mild	May continue dosing based on clinical judgment	Suspend dosing ³	
Moderate or Severe	Suspend dosing ³		

¹ Clinical Symptom Severity Categories:

Mild: discomfort noticed, but no disruption of normal daily activity.

Moderate: discomfort sufficient to reduce or affect normal daily activity.

Severe: incapacitating, with inability to work or to perform normal daily activity.

² See Table 4 for MRI radiographic severity [*Warnings and Precautions (5.1)*].

³ Suspend until MRI demonstrates radiographic resolution and symptoms, if present, resolve; consider a follow-up MRI to assess for resolution 2 to 4 months after initial identification. Resumption of dosing should be guided by clinical judgment.

ARIA-H

The recommendations for dosing interruptions for patients with ARIA-H are provided in Table 3.

Table 3: Dosing Recommendations for Patients with ARIA-H

Clinical Symptom Severity	ARIA-H Severity on MRI ¹		
	Mild	Moderate	Severe
Asymptomatic	May continue dosing	Suspend dosing ²	Suspend dosing ³
Symptomatic	Suspend dosing ²	Suspend dosing ²	

¹ See Table 4 for MRI radiographic severity [*Warnings and Precautions (5.1)*].

² Suspend until MRI demonstrates radiographic stabilization and symptoms, if present, resolve; resumption of dosing should be guided by clinical judgment; consider a follow-up MRI to assess for stabilization 2 to 4 months after initial identification.

³ Suspend until MRI demonstrates radiographic stabilization and symptoms, if present, resolve; use clinical judgment in considering whether to continue treatment or permanently discontinue LEQEMBI.

In patients who develop intracerebral hemorrhage greater than 1 cm in diameter during treatment with LEQEMBI, suspend dosing until MRI demonstrates radiographic stabilization and symptoms, if present, resolve. Use clinical judgment in considering whether to continue treatment after radiographic stabilization and resolution of symptoms or permanently discontinue LEQEMBI.

2.5 Preparation and Administration of LEQEMBI for Intravenous Infusion

Dilution

- Prior to intravenous administration, LEQEMBI must be diluted in 250 mL of 0.9% Sodium Chloride Injection, USP.
- Use aseptic technique when preparing the LEQEMBI diluted solution for intravenous infusion.

- Calculate the dose (mg), the total volume (mL) of LEQEMBI solution required, and the number of vials needed based on the patient's actual body weight and the recommended dose of 10 mg/kg. Each vial contains a LEQEMBI concentration of 100 mg/mL.
- Parenteral drug products should be inspected visually for particulate matter and discoloration prior to administration, whenever solution and container permit. Check that the LEQEMBI solution is clear to opalescent and colorless to pale yellow. Do not use if opaque particles, discoloration, or other foreign particles are present.
- Remove the flip-off cap from the vial. Insert the sterile syringe needle into the vial through the center of the rubber stopper.
- Withdraw the required volume of LEQEMBI from the vial(s) and add to an infusion bag containing 250 mL of 0.9% Sodium Chloride Injection, USP.
- Each vial is for one-time use only. Discard any unused portion.
- Gently invert the infusion bag containing the LEQEMBI diluted solution to mix completely. Do not shake.
- After dilution, immediate use is recommended [*see Description (11)*]. If not administered immediately, store LEQEMBI refrigerated at 2°C to 8°C (36°F to 46°F) for up to 4 hours, or at room temperature up to 30°C (86°F) for up to 4 hours. Do not freeze.

Administration

- Visually inspect the LEQEMBI diluted solution for particles or discoloration prior to administration. Do not use if it is discolored, opaque, or foreign particles are seen.
- Prior to infusion, allow the LEQEMBI diluted solution to warm to room temperature.
- Infuse the entire volume of the LEQEMBI diluted solution intravenously over approximately one hour through an intravenous line containing a terminal low-protein binding 0.2 micron in-line filter. Flush infusion line to ensure all LEQEMBI is administered.
- Monitor for any signs or symptoms of an infusion-related reaction during the infusion and consider longer periods of observation if clinically indicated. The infusion rate may be reduced, or the infusion may be discontinued, and appropriate therapy administered as clinically indicated. Consider pre-medication at subsequent dosing with antihistamines, non-steroidal anti-inflammatory drugs, or corticosteroids [*see Warnings and Precautions (5.3)*].

2.6 Preparation and Administration of LEQEMBI IQLIK for Subcutaneous Injection

Instruct patients and/or caregivers on the proper subcutaneous administration of LEQEMBI IQLIK. Direct patients and/or caregivers to follow the directions provided in the Instructions for Use for additional details on administration [*see Instructions for Use*]. Periodically reassess the ability of the patient or caregiver to safely and adequately administer LEQEMBI IQLIK.

- Before injection, remove LEQEMBI IQLIK from the refrigerator and leave at room temperature for 20 minutes. Do not use an external heat source to heat LEQEMBI IQLIK because heat may damage the product.
- Do not shake LEQEMBI IQLIK.

- Visually inspect LEQEMBI IQLIK for particles or discoloration prior to administration. The solution should be a clear to opalescent, colorless to pale yellow solution, and free of visible particles. Do not use LEQEMBI IQLIK if it is cloudy or there are visible particles.
- Do not use LEQEMBI IQLIK if it looks damaged or has been dropped.
- Sites for injection include the abdomen, upper thigh, and back of the upper arm.
- Do not inject into moles, scars, bruises, tattoos or into areas where the skin is red, hard, tender or injured.
- Monitor for signs or symptoms of an injection reaction.

2.7 Missed Dose

Intravenous Infusion

If a starting dosage or maintenance dosage infusion is missed, administer the next dose as soon as possible.

Subcutaneous Injection

If a scheduled dose of the subcutaneous maintenance dosing regimen is missed, administer LEQEMBI IQLIK as soon as possible up to 6 days after the missed dose and administer the next dose on the regularly scheduled day. Thereafter, resume the original dosing schedule.

3 DOSAGE FORMS AND STRENGTHS

Lecanemab-irmb is a clear to opalescent and colorless to pale yellow solution, available as:

Intravenous Infusion

- Injection: 500 mg/5 mL (100 mg/mL) in a single-dose vial
- Injection: 200 mg/2 mL (100 mg/mL) in a single-dose vial

Subcutaneous Injection

- Injection: 360 mg/1.8 mL (200 mg/mL) in a single-dose prefilled autoinjector

4 CONTRAINDICATIONS

LEQEMBI is contraindicated in patients with serious hypersensitivity to lecanemab-irmb or to any of the excipients of LEQEMBI or LEQEMBI IQLIK. Reactions have included angioedema and anaphylaxis [*see Warnings and Precautions (5.2)*].

5 WARNINGS AND PRECAUTIONS

5.1 Amyloid Related Imaging Abnormalities

Monoclonal antibodies directed against aggregated forms of beta amyloid, including LEQEMBI, can cause amyloid related imaging abnormalities (ARIA), characterized as ARIA with edema (ARIA-E), which can be observed on MRI as brain edema or sulcal effusions, and ARIA with hemosiderin deposition (ARIA-H), which includes microhemorrhage and superficial siderosis. ARIA can occur spontaneously in patients with Alzheimer's disease, particularly in patients with MRI findings suggestive of cerebral amyloid angiopathy, such as pretreatment microhemorrhage or superficial siderosis. ARIA-H associated with monoclonal antibodies directed against aggregated forms of beta amyloid generally occurs in association with an occurrence of ARIA-E. ARIA-H of any cause and ARIA-E can occur together.

ARIA usually occurs early in treatment and is usually asymptomatic, although serious and life-threatening events, including seizure and status epilepticus, can occur. ARIA can be fatal. When present, reported symptoms associated with ARIA may include headache, confusion, visual changes, dizziness, nausea, and gait difficulty. Focal neurologic deficits may also occur. Symptoms associated with ARIA usually resolve over time. In addition to ARIA, intracerebral hemorrhages greater than 1 cm in diameter have occurred in patients treated with LEQEMBI.

Consider the benefit of LEQEMBI for the treatment of Alzheimer's disease and potential risk of serious adverse events associated with ARIA when deciding to initiate treatment with LEQEMBI.

Incidence of ARIA

Symptomatic ARIA occurred in 3% (29/898) of patients treated with LEQEMBI in Study 2 [see *Clinical Studies (14)*]. Serious symptoms associated with ARIA were reported in 0.7% (6/898) of patients treated with LEQEMBI. Clinical symptoms associated with ARIA resolved in 79% (23/29) of patients during the period of observation. Similar findings were observed in Study 1.

Including asymptomatic radiographic events, ARIA was observed in 21% (191/898) of patients treated with LEQEMBI, compared to 9% (84/897) of patients on placebo in Study 2.

In Study 2, ARIA-E was observed in 13% (113/898) of patients treated with LEQEMBI, compared to 2% (15/897) of patients on placebo. ARIA-H was observed in 17% (152/898) of patients treated with LEQEMBI, compared to 9% (80/897) of patients on placebo. There was no increase in isolated ARIA-H (i.e., ARIA-H in patients who did not also experience ARIA-E) for LEQEMBI compared to placebo.

Incidence of Intracerebral Hemorrhage

Intracerebral hemorrhage greater than 1 cm in diameter was reported in 0.7% (6/898) of patients in Study 2 after treatment with LEQEMBI, compared to 0.1% (1/897) on placebo. Fatal events of intracerebral hemorrhage in patients taking LEQEMBI have been observed.

Risk Factors for ARIA and Intracerebral Hemorrhage

ApoE ε4 Carrier Status

The risk of ARIA, including symptomatic and serious ARIA, is increased in apolipoprotein E ε4 (ApoE ε4) homozygotes.

Approximately 15% of Alzheimer's disease patients are ApoE ε4 homozygotes. In Study 2, 16% (141/898) of patients in the LEQEMBI arm were ApoE ε4 homozygotes, 53% (479/898) were heterozygotes, and 31% (278/898) were noncarriers. The incidence of ARIA was higher in ApoE ε4 homozygotes (45% on LEQEMBI vs. 22% on placebo) than in heterozygotes (19% on LEQEMBI vs 9% on placebo) and noncarriers (13% on LEQEMBI vs 4% on placebo). Among patients treated with LEQEMBI, symptomatic ARIA-E occurred in 9% of ApoE ε4 homozygotes compared to 2% of heterozygotes and 1% noncarriers. Serious events of ARIA occurred in 3% of ApoE ε4 homozygotes, and approximately 1% of heterozygotes and noncarriers. The recommendations on management of ARIA do not differ between ApoE ε4 carriers and noncarriers [see *Dosage and Administration (2.4)*]. Testing for ApoE ε4 status should be performed prior to initiation of treatment to inform the risk of developing ARIA. Prior to testing, prescribers should discuss with patients the risk of ARIA across genotypes and the implications of genetic testing results. Prescribers should inform patients that if

genotype testing is not performed they can still be treated with LEQEMBI; however, it cannot be determined if they are ApoE ε4 homozygotes and at higher risk for ARIA.

Radiographic Findings of Cerebral Amyloid Angiopathy (CAA)

Neuroimaging findings that may indicate CAA include evidence of prior intracerebral hemorrhage, cerebral microhemorrhage, and cortical superficial siderosis. CAA has an increased risk for intracerebral hemorrhage. The presence of an ApoE ε4 allele is also associated with cerebral amyloid angiopathy.

The baseline presence of at least 2 microhemorrhages or the presence of at least 1 area of superficial siderosis on MRI, which may be suggestive of CAA, have been identified as risk factors for ARIA. Patients were excluded from enrollment in Study 2 for the presence of more than 4 microhemorrhages and additional findings suggestive of cerebral amyloid angiopathy (prior cerebral hemorrhage greater than 1 cm in greatest diameter, superficial siderosis, vasogenic edema) or other lesions (aneurysm, vascular malformation) that could potentially increase the risk of intracerebral hemorrhage.

Concomitant Antithrombotic or Thrombolytic Medication

In Study 2, baseline use of antithrombotic medication (aspirin, other antiplatelets, or anticoagulants) was allowed if the patient was on a stable dose. The majority of exposures to antithrombotic medications were to aspirin. Antithrombotic medications did not increase the risk of ARIA with LEQEMBI. The incidence of intracerebral hemorrhage was 0.9% (3/328 patients) in patients taking LEQEMBI with a concomitant antithrombotic medication at the time of the event, compared to 0.6% (3/545 patients) in those who did not receive an antithrombotic. Patients taking LEQEMBI with an anticoagulant alone or combined with an antiplatelet medication or aspirin had an incidence of intracerebral hemorrhage of 2.5% (2/79 patients), compared to none in patients who received placebo.

Fatal cerebral hemorrhage has occurred in a patient taking an anti-amyloid monoclonal antibody in the setting of focal neurologic symptoms of ARIA and the use of a thrombolytic agent.

Additional caution should be exercised when considering the administration of antithrombotics or a thrombolytic agent (e.g., tissue plasminogen activator) to a patient already being treated with LEQEMBI. Because ARIA-E can cause focal neurologic deficits that can mimic an ischemic stroke, treating clinicians should consider whether such symptoms could be due to ARIA-E before giving thrombolytic therapy in a patient being treated with LEQEMBI.

Caution should be exercised when considering the use of LEQEMBI in patients with factors that indicate an increased risk for intracerebral hemorrhage and in particular for patients who need to be on anticoagulant therapy, or patients with findings on MRI that are suggestive of cerebral amyloid angiopathy.

Radiographic Severity

The radiographic severity of ARIA associated with LEQEMBI was classified by the criteria shown in Table 4.

Table 4: ARIA MRI Classification Criteria

ARIA Type	Radiographic Severity		
	Mild	Moderate	Severe
ARIA-E	FLAIR hyperintensity confined to sulcus and/or cortex/subcortex white matter in one location <5 cm	FLAIR hyperintensity 5 to 10 cm in single greatest dimension, or more than 1 site of involvement, each measuring <10 cm	FLAIR hyperintensity >10 cm with associated gyral swelling and sulcal effacement. One or more separate/independent sites of involvement may be noted.
ARIA-H microhemorrhage	≤ 4 new incident microhemorrhages	5 to 9 new incident microhemorrhages	10 or more new incident microhemorrhages
ARIA-H superficial siderosis	1 focal area of superficial siderosis	2 focal areas of superficial siderosis	> 2 areas of superficial siderosis

In Study 2, the majority of ARIA-E radiographic events occurred early in treatment (within the first 7 doses), although ARIA can occur at any time and patients can have more than 1 episode. The maximum radiographic severity of ARIA-E in patients treated with LEQEMBI was mild in 4% (37/898) of patients, moderate in 7% (66/898) of patients, and severe in 1% (9/898) of patients. Resolution on MRI occurred in 52% of ARIA-E patients by 12 weeks, 81% by 17 weeks, and 100% overall after detection. The maximum radiographic severity of ARIA-H microhemorrhage in patients treated with LEQEMBI was mild in 9% (79/898), moderate in 2% (19/898), and severe in 3% (28/898) of patients; superficial siderosis was mild in 4% (38/898), moderate in 1% (8/898), and severe in 0.4% (4/898). Among patients treated with LEQEMBI, the rate of severe radiographic ARIA-E was highest in ApoE ε4 homozygotes 5% (7/141), compared to heterozygotes 0.4% (2/479) or noncarriers 0% (0/278). Among patients treated with LEQEMBI, the rate of severe radiographic ARIA-H was highest in ApoE ε4 homozygotes 13.5% (19/141), compared to heterozygotes 2.1% (10/479) or noncarriers 1.1% (3/278).

Monitoring and Dose Management Guidelines

Recommendations for dosing in patients with ARIA-E depend on clinical symptoms and radiographic severity [see *Dosage and Administration* (2.4)]. Recommendations for dosing in patients with ARIA-H depend on the type of ARIA-H and radiographic severity [see *Dosage and Administration* (2.4)]. Use clinical judgment in considering whether to continue dosing in patients with recurrent ARIA-E.

Baseline brain MRI and periodic monitoring with MRI are recommended [see *Dosage and Administration* (2.4)]. Enhanced clinical vigilance for ARIA is recommended during the first 14 weeks of treatment with LEQEMBI. If a patient experiences symptoms suggestive of ARIA, clinical evaluation should be performed, including MRI if indicated. If ARIA is observed on MRI, careful clinical evaluation should be performed prior to continuing treatment.

There is no experience in patients who continued dosing through symptomatic ARIA-E, or through asymptomatic but radiographically severe ARIA-E. There is limited experience in patients who continued dosing through asymptomatic but radiographically mild to moderate ARIA-E. There are limited data in dosing

patients who experienced recurrent ARIA-E. While experience is limited in these situations, dose management guidelines are provided [see *Dosage and Administration (2.4)*].

Providers should encourage patients to participate in real world data collection (e.g., registries) to help further the understanding of Alzheimer's disease and the impact of Alzheimer's disease treatments. Providers and patients can contact Eisai at 888-274-2378 for a list of currently enrolling programs.

5.2 Hypersensitivity Reactions

Hypersensitivity reactions, including angioedema, bronchospasm, and anaphylaxis, have occurred in patients who were treated with LEQEMBI. If LEQEMBI is being administered intravenously, promptly discontinue the infusion upon the first observation of any signs or symptoms consistent with a hypersensitivity reaction, and initiate appropriate therapy. LEQEMBI is contraindicated in patients with a history of serious hypersensitivity to lecanemab-irmb or to any of the excipients of LEQEMBI or LEQEMBI IQLIK.

5.3 Infusion-Related Reactions

In Study 2, infusion-related reactions were observed in 26% (237/898) of patients treated with LEQEMBI, compared to 7% (66/897) of patients on placebo; and the majority (75%, 178/237) occurred with the first infusion. Infusion-related reactions were mostly mild (69%) or moderate (28%) in severity. Infusion-related reactions resulted in discontinuations in 1% (12/898) of patients treated with LEQEMBI. Symptoms of infusion-related reactions include fever and flu-like symptoms (chills, generalized aches, feeling shaky, and joint pain), nausea, vomiting, hypotension, hypertension, and oxygen desaturation.

After the first infusion in Study 1, 38% of patients treated with LEQEMBI had transient decreased lymphocyte counts to less than $0.9 \times 10^9/L$, compared to 2% in patients on placebo, and 22% of patients treated with LEQEMBI had transient increased neutrophil counts to greater than $7.9 \times 10^9/L$, compared to 1% of patients on placebo. Lymphocyte and neutrophil counts were not obtained after the first infusion in Study 2.

Infusion-related reactions can occur during the infusion or after completion of the infusion. In the event of an infusion-related reaction during the infusion, the infusion rate may be reduced, or the infusion may be discontinued, and appropriate therapy initiated as clinically indicated. Consider prophylactic treatment with antihistamines, acetaminophen, nonsteroidal anti-inflammatory drugs, or corticosteroids prior to future infusions.

6 ADVERSE REACTIONS

The following clinically significant adverse reactions are described elsewhere in the labeling:

- Amyloid Related Imaging Abnormalities [see *Warnings and Precautions (5.1)*]
- Hypersensitivity Reactions [see *Warnings and Precautions (5.2)*]
- Infusion-Related Reactions [see *Warnings and Precautions (5.3)*]

6.1 Clinical Trials Experience

Because clinical trials are conducted under widely varying conditions, adverse reaction rates observed in the clinical trials of a drug cannot be directly compared to rates in the clinical trials of another drug and may not reflect the rates observed in practice.

Clinical Trials with Intravenous Administration

The safety of LEQEMBI has been evaluated in 2090 patients who received at least one dose of LEQEMBI by intravenous infusion. In Studies 1 and 2 in patients with Alzheimer's disease, 1059 patients received LEQEMBI 10 mg/kg every two weeks by intravenous infusion [see *Clinical Studies (14)*]. Of these 1059 patients, 50% were female, 79% were White, 15% were Asian, 12% were of Hispanic or Latino ethnicity, and 2% were Black. The mean age at study entry was 72 years (range from 50 to 90 years).

In the combined double-blind, placebo-controlled period and long-term extension period of Studies 1 and 2, 1604 patients received LEQEMBI for at least 6 months, 1261 patients for at least 12 months, and 965 patients for 18 months.

In the double-blind, placebo-controlled period in Study 1, patients stopped study treatment because of an adverse reaction in 15% of patients treated with LEQEMBI, compared to 6% patients on placebo; in Study 2, patients stopped study treatment because of an adverse reaction in 7% of patients treated with LEQEMBI, compared to 3% patients on placebo. In Study 1, the most common adverse reaction leading to discontinuation of LEQEMBI was infusion-related reactions that led to discontinuation in 2% (4/161) of patients treated with LEQEMBI, compared to 1% (2/245) of patients on placebo. In Study 2, the most common adverse reaction leading to discontinuation of LEQEMBI was ARIA-H microhemorrhages that led to discontinuation in 2% (15/898) of patients treated with LEQEMBI, compared to <1% (1/897) of patients on placebo.

Table 5 shows adverse reactions that were reported in at least 5% of patients treated with LEQEMBI and at least 2% more frequently than in patients on placebo in Study 1.

Table 5: Adverse Reactions Reported in at Least 5% of Patients Treated with LEQEMBI 10 mg/kg Every Two Weeks and at least 2% Higher than Placebo in Study 1

Adverse Reaction	LEQEMBI 10 mg/kg Every Two Weeks N=161 %	Placebo N=245 %
Infusion-related reactions	20	3
Headache	14	10
ARIA-E	10	1
Cough	9	5
Diarrhea	8	5

Table 6 shows adverse reactions that were reported in at least 5% of patients treated with LEQEMBI and at least 2% more frequently than in patients on placebo in Study 2.

Table 6: Adverse Reactions Reported in at Least 5% of Patients Treated with LEQEMBI 10 mg/kg Every Two Weeks and at least 2% Higher than Placebo in Study 2

Adverse Reaction	LEQEMBI 10 mg/kg Every Two Weeks N=898 %	Placebo N=897 %
Infusion-related reactions	26	7
ARIA-H	14	8
ARIA-E	13	2
Headache	11	8
Superficial siderosis of central nervous system	6	3
Rash ¹	6	4
Nausea/Vomiting	6	4

¹ Rash includes acne, erythema, infusion site rash, injection site rash, rash, rash erythematous, rash pruritic, skin reactions, and urticaria.

Less Common Adverse Reactions

Atrial fibrillation occurred in 3% of patients treated with LEQEMBI, compared to 2% in patients on placebo. In Study 1, lymphopenia or decreased lymphocyte count was reported in 4% of patients treated with LEQEMBI after the first dose, compared to less than 1% of patients on placebo [*see Warnings and Precautions (5.3)*]; lymphocytes were not measured after the first dose in Study 2.

Clinical Trials with Subcutaneous Administration

The safety of LEQEMBI IQLIK for maintenance treatment was evaluated in an open-label study, which included 49 patients who received LEQEMBI IQLIK 360 mg by subcutaneous administration once every week. The overall safety profile in these patients was similar to what was observed in patients who received LEQEMBI by intravenous infusion in Study 1 and Study 2. Patients who received LEQEMBI IQLIK experienced localized and systemic injection-related reactions. Localized injection-related reactions included erythema, induration, swelling, heat, pain, pruritis, rash, ecchymosis, and hematoma. Systemic injection-related reactions were observed less frequently, with symptoms of headache, fever, and fatigue. Injection-related reactions in patients receiving LEQEMBI IQLIK were mild or moderate in severity.

8 USE IN SPECIFIC POPULATIONS

8.1 Pregnancy

Risk Summary

There are no adequate data on LEQEMBI use in pregnant women to evaluate for a drug-associated risk of major birth defects, miscarriage, or other adverse maternal or fetal outcomes. No animal studies have been conducted to assess the potential reproductive or developmental toxicity of LEQEMBI.

In the US general population, the estimated background risk of major birth defects and miscarriage in clinically recognized pregnancies is 2% to 4% and 15% to 20%, respectively. The background risk of major birth defects and miscarriage for the indicated population is unknown.

8.2 Lactation

Risk Summary

There are no data on the presence of lecanemab-irmb in human milk, the effects on the breastfed infant, or the effects of the drug on milk production. Published data from other monoclonal antibodies generally indicate low passage of monoclonal antibodies into human milk and limited systemic exposure in the breastfed infant. The effects of this limited exposure are unknown. The developmental and health benefits of breastfeeding should be considered along with the mother's clinical need for LEQEMBI and any potential adverse effects on the breastfed infant from LEQEMBI or from the underlying maternal condition.

8.4 Pediatric Use

Safety and effectiveness of LEQEMBI in pediatric patients have not been established.

8.5 Geriatric Use

In Studies 1 and 2, the age of patients exposed to LEQEMBI 10 mg/kg every two weeks (n=1059) ranged from 50 to 90 years, with a mean age of 72 years; 81% were 65 years and older, and 39% were 75 years and older. No overall differences in safety or effectiveness of LEQEMBI have been observed between patients 65 years of age and older and younger adult patients.

11 DESCRIPTION

Lecanemab-irmb is a recombinant humanized immunoglobulin gamma 1 (IgG1) monoclonal antibody directed against aggregated soluble and insoluble forms of amyloid beta, and is expressed in a Chinese hamster ovary cell line. Lecanemab-irmb has an approximate molecular weight of 150 kDa.

LEQEMBI Injection for Intravenous Use

LEQEMBI (lecanemab-irmb) injection is a sterile, preservative-free, clear to opalescent and colorless to pale yellow solution for intravenous infusion after dilution. LEQEMBI is supplied in single-dose vials available in concentrations of 500 mg/5 mL (100 mg/mL) or 200 mg/2 mL (100 mg/mL).

Each mL of solution contains 100 mg of lecanemab-irmb and arginine hydrochloride (42.13 mg), histidine (0.18 mg), histidine hydrochloride monohydrate (4.99 mg), polysorbate 80 (0.50 mg), and Water for Injection at an approximate pH of 5.0.

LEQEMBI IQLIK Injection for Subcutaneous Use

LEQEMBI IQLIK (lecanemab-irmb) injection is a sterile, preservative-free, clear to opalescent and colorless to pale yellow solution for subcutaneous use. LEQEMBI IQLIK is supplied in a single-dose prefilled autoinjector available in the concentration of 360 mg/1.8 mL with a 29-gauge fixed ½-inch needle. Each LEQEMBI IQLIK autoinjector contains 360 mg/1.8 mL lecanemab-irmb formulated in: arginine hydrochloride (75.83 mg), histidine (0.25 mg), histidine hydrochloride monohydrate (9.09 mg), polysorbate 80 (0.90 mg), and Water for Injection, USP.

12 CLINICAL PHARMACOLOGY

12.1 Mechanism of Action

Lecanemab-irmb is a humanized immunoglobulin gamma 1 (IgG1) monoclonal antibody directed against aggregated soluble and insoluble forms of amyloid beta. The accumulation of amyloid beta plaques in the brain is a defining pathophysiological feature of Alzheimer's disease. LEQEMBI reduces amyloid beta plaques, as evaluated in Study 1 and Study 2 [see *Clinical Studies (14)*].

12.2 Pharmacodynamics

Effect of LEQEMBI on Amyloid Beta Pathology

The effect of LEQEMBI on amyloid beta plaque levels in the brain was evaluated using Positron Emission Tomography (PET) imaging. The PET signal was quantified using both the standard uptake value ratio (SUVR) and Centiloid scale to estimate levels of amyloid beta plaque in composites of brain areas expected to be widely affected by Alzheimer's disease pathology (frontal, parietal, lateral temporal, sensorimotor, and anterior and posterior cingulate cortices), compared to a brain region expected to be spared of such pathology (cerebellum).

LEQEMBI reduced amyloid beta plaque in a dose- and time-dependent manner in the dose-ranging study (Study 1) and in a time-dependent manner in single-dosing regimen study (Study 2) compared to placebo [see *Clinical Studies (14)*].

In Study 1, treatment with LEQEMBI 10 mg/kg every two weeks reduced amyloid beta plaque levels in the brain, producing reductions in PET SUVR compared to placebo at both Weeks 53 and 79 ($P < 0.0001$). The magnitude of the reduction was time- and dose-dependent.

During an off-treatment period in Study 1 (range from 9 to 59 months; mean of 24 months), SUVR and Centiloid values began to increase with a mean rate of increase of 2.6 Centiloids/year, however, treatment difference relative to placebo at the end of the double-blind, placebo-controlled period in Study 1 was maintained.

In Study 2, treatment with LEQEMBI 10 mg/kg every two weeks reduced amyloid beta plaque levels in the brain, producing reductions compared to placebo starting at Week 13 and continuing through Week 79 ($P < 0.0001$). After Week 79 of treatment with LEQEMBI 10 mg/kg every two weeks, 67% of patients had amyloid levels less than 30 Centiloids as measured by PET. Reduction of amyloid to levels less than 30 Centiloids was inversely related to amyloid PET levels at baseline. The percentage of patients achieving amyloid levels less than 30 Centiloids after continuous treatment with LEQEMBI 10 mg/kg every two weeks is predicted to increase over time. It is predicted that, after Week 79 of treatment with LEQEMBI intravenous infusion of 10 mg/kg every 2 weeks, transitioning to a dosing regimen of either LEQEMBI intravenous infusion of 10 mg/kg every 4 weeks or a LEQEMBI IQLIK subcutaneous injection of 360 mg once a week will also continue the reduction in amyloid beta plaque levels. Based on exposure-response modeling, the intravenous (10 mg/kg every 4 weeks) and subcutaneous (360 mg once weekly) maintenance dosing regimens of lecanemab-irmb are predicted to have similar reduction of amyloid beta plaque levels.

An increase in plasma A β 42/40 ratio (Table 6) and CSF A β [1-42] was observed with LEQEMBI 10 mg/kg every two weeks dosing compared to placebo. Exposure-response modeling predicts that, after Week 79 of treatment with LEQEMBI intravenous infusion of 10 mg/kg every 2 weeks, transitioning to a dosing regimen of either LEQEMBI intravenous infusion of 10 mg/kg every 4 weeks or a LEQEMBI IQLIK subcutaneous injection of 360 mg once a week will maintain increases in the plasma A β 42/40 ratio.

Effect of LEQEMBI on Tau Pathophysiology

A reduction in plasma p-tau181 (Table7), CSF p-tau181, and CSF t-tau was observed with LEQEMBI 10 mg/kg every two weeks compared to placebo. Exposure-response modeling predicts that, after Week 79 of treatment with LEQEMBI intravenous infusion of 10 mg/kg every two weeks, transitioning to a dosing regimen of LEQEMBI intravenous infusion of 10 mg/kg every 4 weeks or a LEQEMBI IQLIK subcutaneous injection of 360 mg once a week will maintain the reduction in plasma p-tau181.

Table7: Effect of LEQEMBI on Plasma A β 42/40 and Plasma p-tau181 in Study 1 and Study 2

Biomarker Endpoints	Study 1		Study 2	
	LEQEMBI 10 mg/kg Every Two Weeks	Placebo	LEQEMBI 10 mg/kg Every Two Weeks	Placebo
Plasma Aβ42/40²	N=43	N=88	N=797	N=805
Mean baseline	0.08	0.09	0.09	0.09
Adjusted mean change from baseline at Month 18 ³	0.01	<0.01	0.01	<0.01
Difference from placebo	0.01 ($P=0.0036$) ¹		0.01 ($P<0.0001$) ¹	
Plasma p-tau181 (pg/mL)²	N=84	N=179	N=746	N=752
Mean baseline	4.65	4.44	3.70	3.74
Adjusted mean change from baseline at Month 18 ³	-1.11	0.08	-0.58	0.20
Difference from placebo	-1.20 ($P<0.0001$) ¹		-0.78 ($P<0.0001$) ¹	

N is the number of patients with baseline value.

¹ P values were not statistically controlled for multiple comparisons.

² Results should be interpreted with caution due to uncertainties in bioanalysis.

³ Month 18 represents Week 79 in Study 1 and Week 77 in Study 2.

A substudy was conducted in Study 2 to evaluate the effect of LEQEMBI on neurofibrillary tangles composed of tau protein using PET imaging (¹⁸F-MK6240 tracer). The PET signal was quantified using the SUVR method to estimate brain levels of tau in brain regions expected to be affected by Alzheimer's disease pathology (whole cortical gray matter, meta-temporal, frontal, cingulate, parietal, occipital, medial temporal, and temporal) in the study population, compared to a brain region expected to be spared of such pathology (cerebellum). The adjusted mean change from baseline in tau PET SUVR, relative to placebo, was in favor of LEQEMBI in the medial temporal ($P<0.01$), meta temporal ($P<0.05$), and temporal ($P<0.05$) regions. No statistically significant differences were observed for the whole cortical gray matter, frontal, cingulate, parietal, or occipital regions.

Exposure-Response Relationships

Model-based exposure-response analyses demonstrated that higher exposures to lecanemab-irmb were associated with greater reduction in clinical decline on Clinical Dementia Rating scale Sum of Boxes (CDR-SB) and Alzheimer Disease Assessment Scale – Cognitive Subscale 14 (ADAS-Cog14). In addition, higher exposures to lecanemab-irmb were associated with greater reduction in amyloid beta plaque. An association between reduction in amyloid beta plaque and clinical decline on CDR-SB and ADAS-Cog14 was also observed.

Higher exposures to lecanemab-irmb were also associated with greater increase in plasma A β 42/40 ratio and greater reduction in plasma p-tau181.

12.3 Pharmacokinetics

Steady-state concentrations of lecanemab-irmb were reached after 6 weeks of 10 mg/kg administered every 2 weeks and systemic accumulation was 1.4-fold. The peak concentration (C_{\max}) and area under the plasma concentration versus time curve (AUC) of lecanemab-irmb increased dose proportionally in the dose range of 0.3 to 15 mg/kg following single dose.

The estimated mean steady-state concentrations of lecanemab-irmb following 10 mg/kg biweekly intravenous infusion, 10 mg/kg monthly intravenous infusion and 360 mg weekly subcutaneous administration by autoinjector are provided in Table 8. Using population pharmacokinetic modeling and simulation, the intravenous (10 mg/kg once every 4 weeks) and subcutaneous (360 mg once weekly) maintenance dosing regimens of lecanemab-irmb were predicted to have similar pharmacokinetic exposure.

Table 8: Estimated Systemic Exposure of Lecanemab-irmb at Steady State in Patients with Alzheimer's Disease*

	$C_{\text{avg,ss}}$ (mcg/mL) Mean (CV%)
Intravenous infusion 10 mg/kg every two weeks	156 (37.7)
Intravenous infusion 10 mg/kg every four weeks	78.1 (37.7)
Subcutaneous injection 360 mg weekly	83.1 (58.8)

*Based on simulations in 1000 virtual patients

Absorption

The bioavailability of lecanemab-irmb following subcutaneous administration of 360 mg by autoinjector relative to a 10 mg/kg intravenous infusion in patients was approximately 53% and was not affected by the injection site (abdomen, upper thigh, or back of the upper arm).

Distribution

The mean value (95% CI) for central volume of distribution at steady state is 3.24 (3.18-3.30) L.

Elimination

Lecanemab-irmb is degraded by proteolytic enzymes in the same manner as endogenous IgGs. The clearance of lecanemab-irmb (95% CI) is 0.370 (0.353-0.384) L/day. The terminal half-life is 5 to 7 days.

Specific Populations

Sex, body weight, and albumin were found to impact exposure to lecanemab-irmb. However, none of these covariates were found to be clinically significant.

Patients with Renal or Hepatic Impairment

No clinical studies were conducted to evaluate the pharmacokinetics of lecanemab-irmb in patients with renal or hepatic impairment. Lecanemab-irmb is degraded by proteolytic enzymes and is not expected to undergo renal elimination or metabolism by hepatic enzymes.

12.6 Immunogenicity

The observed incidence of anti-drug antibodies is highly dependent on the sensitivity and specificity of the assay. Differences in assay methods preclude meaningful comparisons of the incidence of anti-drug antibodies in the studies described below with the incidence of anti-drug antibodies in other studies, including those of lecanemab-irmb or of other lecanemab products.

Intravenous Infusion

During the 18-month treatment period in Study 1, 63/154 (40.9%) of patients treated with LEQEMBI 10 mg/kg every two weeks by intravenous infusion developed anti-lecanemab-irmb antibodies. Of these patients, neutralizing anti-lecanemab-irmb antibodies were detected in 16/63 (25.4%) patients. However, the assays used to measure anti-lecanemab-irmb antibodies and neutralizing antibodies are subject to interference by serum lecanemab concentrations, possibly resulting in an underestimation of the incidence of antibody formation. Therefore, there is insufficient information to characterize the effects of anti-lecanemab-irmb antibodies on pharmacokinetics, pharmacodynamics, safety, or effectiveness of LEQEMBI.

Subcutaneous Injection

After 18 months of intravenous LEQEMBI 10 mg/kg once every 2 weeks, patients who received 360 mg subcutaneous LEQEMBI IQLIK once weekly in the open-label portion of Study 2 were assessed for immunogenicity using a different assay that was drug-tolerant for anti-lecanemab-irmb antibodies and neutralizing antibodies. The anti-lecanemab-irmb antibody incidence was 2.0% (1/49) following a median treatment duration of 83 days with 360 mg subcutaneous LEQEMBI IQLIK. Neutralizing anti-lecanemab-irmb antibodies were not detected in this patient. Because of the limited data regarding anti-lecanemab-irmb antibodies, there is insufficient information to characterize the effects of anti-lecanemab-irmb antibodies on the pharmacokinetics, pharmacodynamics, safety, or effectiveness of subcutaneous LEQEMBI IQLIK.

13 NONCLINICAL TOXICOLOGY

13.1 Carcinogenesis, Mutagenesis, Impairment of Fertility

Carcinogenesis

Carcinogenicity studies have not been conducted.

Mutagenesis

Genotoxicity studies have not been conducted.

Impairment of Fertility

No studies in animals have been conducted to assess the effects of lecanemab-irmb on male or female fertility. No adverse effects on male or female reproductive organs were observed in a 39-week intravenous toxicity study in monkeys administered lecanemab-irmb weekly at doses up to 100 mg/kg. The highest dose tested was associated with plasma exposures (C_{ave}) approximately 27 times that in humans at the recommended human dose (10 mg/kg every two weeks).

14 CLINICAL STUDIES

The efficacy of LEQEMBI was evaluated in two double-blind, placebo-controlled, parallel-group, randomized studies (Study 1, NCT01767311; Study 2 NCT03887455) in patients with Alzheimer's disease (patients with

confirmed presence of amyloid pathology and mild cognitive impairment [64% of patients in Study 1; 62% of patients in Study 2] or mild dementia stage of disease [36% of patients in Study 1; 38% of patients in Study 2], consistent with Stage 3 and Stage 4 Alzheimer's disease). In both studies, patients were enrolled with a Clinical Dementia Rating (CDR) global score of 0.5 or 1.0 and a Memory Box score of 0.5 or greater. All patients had a Mini-Mental State Examination (MMSE) score of ≥ 22 and ≤ 30 , and had objective impairment in episodic memory as indicated by at least 1 standard deviation below age-adjusted mean in the Wechsler-Memory Scale-IV Logical Memory II (subscale) (WMS-IV LMII). Patients were enrolled with or without concomitant approved therapies (cholinesterase inhibitors and the N-methyl-D-aspartate antagonist memantine) for Alzheimer's disease. The dosage of 10 mg/kg administered once every 2 weeks by intravenous infusion was assessed in the 18-month placebo-controlled portions of Study 1 and Study 2 and continued in the optional long-term extension in each study. Transitioning to intravenous 10 mg/kg once every 4 weeks or subcutaneous 360 mg every week after 18 months of dosing is supported by pharmacokinetic and pharmacodynamic modeling using observed data [see *Clinical Pharmacology* (12.2)]; however, there are limited data to assess the long-term clinical benefit of transitioning to the dosing regimen of intravenous 10 mg/kg once every 4 weeks or subcutaneous 360 mg every week [see *Dosage and Administration* (2.2)].

Study 1

In Study 1, 856 patients were randomized to receive one of 5 doses (161 of which were randomized to the recommended dosing regimen of 10 mg/kg every two weeks) of intravenous infusion of LEQEMBI or placebo (n=247). Of the total number of patients randomized, 71.4% were ApoE $\epsilon 4$ carriers and 28.6% were ApoE $\epsilon 4$ non-carriers. During the study, the protocol was amended to no longer randomize ApoE $\epsilon 4$ carriers to the 10 mg/kg every two weeks dose arm. ApoE $\epsilon 4$ carriers who had been receiving LEQEMBI 10 mg/kg every two weeks for 6 months or less were discontinued from study drug. As a result, in the LEQEMBI 10 mg/kg every two weeks arm, 30.3% of patients were ApoE $\epsilon 4$ carriers and 69.7% were ApoE $\epsilon 4$ non-carriers. At baseline, the mean age of randomized patients was 71 years, with a range of 50 to 90 years. Fifty percent of patients were male and 90% were White.

In Study 1, a subgroup of 315 patients were enrolled in the amyloid PET substudy; of these, 277 were evaluated at Week 79. Results from the amyloid beta PET substudy are described in Figure 1 and Table 9. Plasma biomarkers are described in Table 7.

Figure 1: Reduction in Brain Amyloid Beta Plaque (Adjusted Mean Change from Baseline in Amyloid Beta PET Composite, SUVR and Centiloids) in Study 1

Table 9: Results for Amyloid Beta PET in Study 1

Biomarker Endpoints	LEQEMBI 10 mg/kg Every Two Weeks	Placebo
Amyloid Beta PET Composite SUVR	N=44	N=98
Mean baseline	1.373	1.402
Adjusted mean change from baseline at Week 79	-0.306	0.004
Difference from placebo	-0.310 (P<0.001) ¹	
Amyloid Beta PET Centiloid	N=44	N=98
Mean baseline	78.0	84.8
Adjusted mean change from baseline at Week 79	-72.5	1.0
Difference from placebo	-73.5 (P<0.001) ¹	

N is the number of patients with baseline value.
¹ P values were not statistically controlled for multiple comparisons.

The primary endpoint was change from baseline on a weighted composite score consisting of selected items from the Clinical Dementia Rating scale Sum of Boxes (CDR-SB), MMSE, and Alzheimer Disease Assessment Scale – Cognitive Subscale 14 (ADAS-Cog14) at Week 53. LEQEMBI had a 64% likelihood of 25% or greater slowing of progression on the primary endpoint relative to placebo at Week 53, which did not meet the prespecified success criterion of 80%.

Key secondary efficacy endpoints included the change from baseline in amyloid PET SUVR composite at Week 79 and change from baseline in the CDR-SB and ADAS-Cog14 at Week 79. Results for clinical assessments showed less change from baseline in CDR-SB and ADAS-Cog14 scores at Week 79 in the LEQEMBI group than in patients on placebo (CDR-SB: -0.40 [26%], 90% CI [-0.82, 0.03]; ADAS-Cog14: -2.31 [47%], 90% CI [-3.91, -0.72]).

After the 79-week double-blind, placebo-controlled period of Study 1, patients could enroll in an open-label extension period for up to 260 weeks, which was initiated after a gap period (range 9 to 59 months; mean 24 months) off treatment.

Study 2

In Study 2, 1795 patients were enrolled and randomized 1:1 to receive intravenous infusion of LEQEMBI 10 mg/kg or placebo once every 2 weeks. Of the total number of patients randomized, 69% were ApoE ϵ 4 carriers and 31% were ApoE ϵ 4 non-carriers. Overall median age of patients was 72 years, with a range of 50 to 90 years. Fifty-two percent were women, and 1381 (77%) were White, 303 (17%) were Asian, and 47 (3%) were Black.

The randomization was stratified according to clinical subgroup (mild cognitive impairment or mild dementia stage of the disease); the presence or absence of concomitant approved therapies for Alzheimer's disease at baseline (cholinesterase inhibitors and the N-methyl-D-aspartate antagonist memantine); ApoE ϵ 4 carrier status; and geographical region.

The primary efficacy outcome was change from baseline at 18 months in the CDR-SB. Key secondary endpoints included change from baseline at 18 months for the following measures: amyloid Positron Emission Tomography (PET) using Centiloids, ADAS-Cog14, and Alzheimer's Disease Cooperative Study-Activities of Daily Living Scale for Mild Cognitive Impairment (ADCS MCI-ADL).

LEQEMBI treatment met the primary endpoint and reduced clinical decline on the global cognitive and functional scale, CDR-SB, compared to placebo at 18 months (-0.45 [-27%], $P < 0.0001$).

Statistically significant differences ($P < 0.01$) between treatment groups were also seen in the results for ADAS-Cog14 and ADCS MCI-ADL at 18 months, as presented in Table 10.

Both ApoE ϵ 4 carriers and ApoE ϵ 4 noncarriers showed statistically significant treatment differences for the primary endpoint and all secondary endpoints. In an exploratory subgroup analysis of ApoE ϵ 4 homozygotes, which represented 15% of the trial population, a treatment effect was not observed with LEQEMBI treatment on the primary endpoint, CDR-SB, compared to placebo, although treatment effects that favored LEQEMBI were observed for the secondary clinical endpoints, ADAS-Cog14 and ADCS MCI-ADL. Treatment effects on disease-relevant biomarkers (amyloid beta PET, plasma A β 42/40 ratio, plasma p-tau 181) also favored LEQEMBI in the ApoE ϵ 4 homozygous subgroup.

Starting at six months, across all time points, LEQEMBI treatment showed statistically significant changes in the primary and all key secondary endpoints from baseline compared to placebo; see Figure 2.

Table 10: Results for CDR-SB, ADAS-Cog14, and ADCS MCI-ADL in Study 2

Clinical Endpoints	LEQEMBI 10 mg/kg Every Two Weeks	Placebo
CDR-SB	N=859	N=875
Mean baseline	3.17	3.22
Adjusted mean change from baseline at 18 months (%) Difference from placebo	1.21 -0.45 (-27%) ($P<0.0001$)	1.66
ADAS-Cog14	N=854	N=872
Mean baseline	24.45	24.37
Adjusted mean change from baseline at 18 months (%) Difference from placebo	4.14 -1.44 (-26%) ($P=0.0007$)	5.58

16 HOW SUPPLIED/STORAGE AND HANDLING

16.1 How Supplied

LEQEMBI single-dose vials and LEQEMBI IQLIK single-dose prefilled autoinjectors contain lecanemab-irmb as a sterile, preservative-free, clear to opalescent, and colorless to pale yellow solution, available as described below.

Intravenous Infusion

Each LEQEMBI glass vial is closed with a stopper and flip cap and is available as follows:

Strength	Pack Size	NDC
Injection: 500 mg/5 mL (100 mg/mL)	Carton of 1 single-dose vial	62856-215-01
Injection: 200 mg/2 mL (100 mg/mL)	Carton of 1 single-dose vial	62856-212-01

Subcutaneous Injection

Each LEQEMBI IQLIK prefilled autoinjector consists of a 2.25 mL glass syringe with a fixed 29-gauge ½-inch needle with needle guard and is available as follows:

Strength	Pack Size	NDC
Injection: 360 mg/1.8 mL (200 mg/mL)	Carton of 1 single-dose prefilled autoinjector	62856-220-01

LEQEMBI IQLIK is not made with natural rubber latex.

16.2 Storage and Handling

Intravenous Infusion

Unopened Vial

- Store LEQEMBI vials in a refrigerator at 2°C to 8°C (36°F to 46°F).
- Store in the original carton to protect from light.
- Do not freeze or shake.

Diluted Solution

For storage of the diluted infusion solution, see *Dosage and Administration* (2.5).

Subcutaneous Injection

- Store LEQEMBI IQLIK autoinjectors in a refrigerator at 2°C to 8°C (36°F to 46°F).

- Store in original carton to protect from light.
- Do not freeze.
- If needed, the autoinjector can be stored at room temperature up to 25°C (77°F) in the original carton for up to 14 days. Once the autoinjector has been stored at room temperature, do not return it to the refrigerator.
- Discard the autoinjector if these conditions are exceeded.

17 PATIENT COUNSELING INFORMATION

Advise the patient and/or caregiver to read the FDA-approved patient labeling (Medication Guide and Instructions for Use).

Amyloid Related Imaging Abnormalities

Inform patients that LEQEMBI may cause Amyloid Related Imaging Abnormalities or “ARIA”. ARIA most commonly presents as a temporary swelling in areas of the brain that usually resolves over time. Some people may also have small spots of bleeding in or on the surface of the brain. Inform patients that most people with swelling in areas of the brain do not experience symptoms; however, some people may experience symptoms such as headache, confusion, dizziness, vision changes, nausea, aphasia, weakness, or seizure. Instruct patients to notify their healthcare provider immediately if these symptoms occur. Clinical evaluation should be performed, and an MRI may be considered. Inform patients that serious symptoms of ARIA may occur and that ARIA can be fatal. Inform patients that events of intracerebral hemorrhage greater than 1 cm in diameter have been reported infrequently in patients taking LEQEMBI, and that the use of antithrombotic or thrombolytic medications while taking LEQEMBI may increase the risk of bleeding in the brain. Notify patients that their healthcare provider will perform MRI scans to monitor for ARIA [see *Warnings and Precautions* (5.1)].

Inform patients that although ARIA can occur in any patient treated with LEQEMBI, there is an increased risk in patients who are ApoE ε4 homozygotes and that testing for ApoE ε4 status should be performed prior to initiation of treatment to inform the risk of developing ARIA. Prior to testing, discuss with patients the risk of ARIA across genotypes and the implications of genetic testing results. Inform patients that if testing is not performed, it cannot be determined if they are ApoE ε4 homozygotes and at a higher risk for ARIA.

Inform patients that some symptoms of ARIA-E can mimic ischemic stroke and that their healthcare providers may need to perform additional testing to determine how to treat those symptoms in patients taking LEQEMBI. Advise patients to carry information that they are being treated with LEQEMBI.

Patient Registry

Providers should encourage patients to participate in real world data collection (e.g., registries) to help further the understanding of Alzheimer’s disease and the impact of Alzheimer’s disease treatments. Providers and patients can contact Eisai at 888-274-2378 for a list of currently enrolling programs [see *Warnings and Precautions* (5.1)].

Hypersensitivity Reactions

Inform patients that hypersensitivity reactions, including angioedema and anaphylaxis have occurred in patients who were treated with LEQEMBI. Advise patients to seek immediate medical attention if they experience any symptoms of serious or severe hypersensitivity reactions [see *Warnings and Precautions* (5.2)].

Infusion-Related Reactions

For patients receiving LEQEMBI via intravenous infusion, advise them of the potential risk of infusion-related reactions, which can include flu-like symptoms, nausea, vomiting, and changes in blood pressure. Advise patients that most infusion-related reactions occur with the first infusion but may occur with any of the infusions during treatment. Advise patients that symptoms can occur during infusion or after they leave the infusion center and to contact their healthcare provider if infusion-related reactions occur [*see Warnings and Precautions (5.3)*].

Injection-Related Reactions

For patients receiving LEQEMBI IQLIK via subcutaneous injection, advise them of the potential risks of injection reactions, which may present as erythema, induration, swelling, heat, rash, pain, itching, ecchymosis and hematoma at the injection site, but may also present with symptoms such as headache, fever and fatigue. Instruct patients to contact their healthcare provider if injection-related reactions occur [*see Adverse Reactions (6.1)*].

MEDICATION GUIDE
LEQEMBI® (leh-kem'-bee)
(lecanemab-irmb)

injection, for intravenous or subcutaneous use

What is the most important information I should know about LEQEMBI?

LEQEMBI can cause serious side effects including:

- **Amyloid Related Imaging Abnormalities or “ARIA”.** ARIA is a side effect that does not usually cause any symptoms but serious symptoms can occur. ARIA can be fatal. It is most commonly seen as temporary swelling in areas of the brain that usually resolves over time. Some people may also have small spots of bleeding in or on the surface of the brain, and infrequently, larger areas of bleeding in the brain can occur. Most people who develop ARIA do not get symptoms; however, some people may have symptoms, such as:

- | | | |
|-------------|----------------------|-----------------------|
| ○ headache | ○ vision changes | ○ seizures |
| ○ confusion | ○ nausea | ○ difficulty speaking |
| ○ dizziness | ○ difficulty walking | ○ muscle weakness |

Some people have a genetic risk factor (homozygous apolipoprotein E gene carriers) that may cause an increased risk for ARIA. Talk to your healthcare provider about testing to see if you have this risk factor.

You may be at a higher risk of developing bleeding in the brain if you take medicines to reduce blood clots from forming (antithrombotic medicines) while receiving LEQEMBI.

Your healthcare provider will do magnetic resonance imaging (MRI) scans before and during your treatment with LEQEMBI to check you for ARIA.

You should carry information that you are receiving LEQEMBI which can cause ARIA and that ARIA symptoms can look like stroke symptoms.

Call your healthcare provider or go to the nearest hospital emergency room right away if you have any of the symptoms listed above.

There are registries that collect information on treatments for Alzheimer's disease. Your healthcare provider can help you become enrolled in these registries. For more information, call Eisai at 888-274-2378.

What is LEQEMBI?

LEQEMBI is a prescription medicine used to treat people with Alzheimer's disease.

It is not known if LEQEMBI is safe and effective in children.

Do not receive LEQEMBI if you:

- have serious allergic reactions to lecanemab-irmb or to any of the ingredients in LEQEMBI or LEQEMBI IQLIK. See the end of this Medication Guide for a complete list of ingredients in LEQEMBI or LEQEMBI IQLIK.

Before receiving LEQEMBI, tell your healthcare provider about all of your medical conditions, including if you:

- are pregnant or plan to become pregnant. It is not known if LEQEMBI will harm your unborn baby. Tell your healthcare provider if you become pregnant during your treatment with LEQEMBI.
- are breastfeeding or plan to breastfeed. It is not known if lecanemab-irmb (the active ingredient in LEQEMBI) passes into your breast milk. Talk to your healthcare provider about the best way to feed your baby while receiving LEQEMBI.

Tell your healthcare provider about all of the medicines you take, including prescription and over-the-counter medicines, vitamins, and herbal supplements.

Especially tell your healthcare provider if you take medicines to reduce blood clots from forming (antithrombotic medicines, including aspirin). Ask your healthcare provider for a list of these medicines if you are not sure.

Know the medicines you take. Keep a list of them to show your healthcare provider and pharmacist when you get a new medicine.

How will I receive LEQEMBI?

When given in a vein (intravenously)

- LEQEMBI is given by a healthcare provider through a needle placed in your vein (intravenous (IV) infusion) in your arm.
- Your healthcare provider will tell you how often you should receive LEQEMBI. Each infusion will last about 1 hour.
- If you miss an infusion of LEQEMBI, you should receive your next dose as soon as possible.

When given under the skin (subcutaneously)

Read the detailed Instructions for Use that comes with your LEQEMBI IQLIK for information about the right way to prepare and give your LEQEMBI IQLIK injections at home.

- Your healthcare provider will show you how to use LEQEMBI IQLIK and tell you how often you should use it. Use LEQEMBI IQLIK exactly as your healthcare provider tells you to.
- LEQEMBI IQLIK is given as an injection under your skin (subcutaneous injection), into the front of your thighs or stomach-area (abdomen) by you or a caregiver. A caregiver may also give you an injection of LEQEMBI IQLIK in the back of your upper arm.
- Do not inject into moles, scars, bruises, tattoos, or into areas where the skin is red, hard, tender, or injured.
- Use a different injection site the next time you use LEQEMBI IQLIK.
- If you miss a dose of LEQEMBI IQLIK, inject the missed dose as soon as possible up to 6 days after the missed dose. Continue (resume) your next injection on your regular dosing schedule.

What are the possible side effects of LEQEMBI?

LEQEMBI can cause serious side effects, including:

- **see “What is the most important information I should know about LEQEMBI?”**
- **serious allergic reactions.** Swelling of the face, lips, mouth, or tongue, hives, or difficulty breathing have happened during treatment with LEQEMBI. Tell your healthcare provider if you have any symptoms of a serious allergic reaction during or after LEQEMBI infusion.
- **infusion-related reactions.** Infusion-related reactions are a common side effect with LEQEMBI injection into a vein (intravenously), which can be serious. You will receive your infusion at a healthcare facility. If a serious infusion reaction happens while you are receiving LEQEMBI, your infusion may be stopped. Serious infusion reactions can also occur after completion of the infusion. Tell your healthcare provider right away if you get these symptoms during an infusion or after completion of the LEQEMBI infusion:
 - fever
 - flu-like symptoms (chills, body aches, feeling shaky, and joint pain)
 - nausea
 - vomiting
 - dizziness or lightheadedness
 - changes in your heart rate or feel like your chest is pounding
 - difficulty breathing or shortness of breath
 - changes in blood pressure

If you have an infusion-related reaction, your healthcare provider may give you medicines before your LEQEMBI infusions to decrease your chance of having an infusion-related reaction. These medicines may include antihistamines, anti-inflammatory medicines, or steroids.

- **injection-related reactions.** Injection-related reactions may occur with LEQEMBI injection under the skin (subcutaneous injection with LEQEMBI IQLIK). Redness, swelling, heat, pain, itching, rash, bruising and blood collection under the skin at the injection site may be observed. Headache, fatigue, or fever may also be observed after an injection. Tell your healthcare provider if you experience these symptoms during or after an injection.

The most common side effects of LEQEMBI include:

- infusion-related reactions
- swelling in areas of the brain, with or without small spots of bleeding in or on the surface of the brain (ARIA)
- headache

These are not all the possible side effects of LEQEMBI. For more information, ask your healthcare provider or pharmacist.

Call your doctor for medical advice about side effects. You may report side effects to FDA at 1-800-FDA-1088.

How should I store LEQEMBI IQLIK?

- Store LEQEMBI IQLIK autoinjectors in a refrigerator between 36°F to 46°F (2°C to 8°C).
- Do not freeze.
- Keep LEQEMBI IQLIK autoinjector in the original package until ready to use, to protect from light.
- LEQEMBI IQLIK may be stored at room temperature up to 77°F (25°C) for up to 14 days in the original package. Do not place it back in the refrigerator if it has been brought to room temperature.
- Do not shake LEQEMBI IQLIK.
- Throw away (dispose of) LEQEMBI IQLIK that is out of date, or if it is not stored the right way.

Keep LEQEMBI IQLIK and all medicines out of the reach of children.

General information about the safe and effective use of LEQEMBI.

Medicines are sometimes prescribed for purposes other than those listed in a Medication Guide. Do not use LEQEMBI for a condition for which it was not prescribed. Do not give LEQEMBI to other people, even if they have the same symptoms that you have. It may harm them.

You can ask your pharmacist or healthcare provider for information about LEQEMBI that is written for health professionals.

What are the ingredients in LEQEMBI?

Active ingredient: lecanemab-irmb.

Inactive ingredients (intravenous): arginine hydrochloride, histidine, histidine hydrochloride monohydrate, polysorbate 80, and water for injection.

Inactive ingredients (subcutaneous): arginine hydrochloride, histidine, histidine hydrochloride monohydrate, polysorbate 80, and water for injection.

INSTRUCTIONS FOR USE
LEQEMBI® IQLIK™ (le-KEM-bee)
(lecanemab-irmb)
360 mg/1.8 mL
injection, for subcutaneous use
single-dose prefilled autoinjector

This Instructions for Use contains information on how to prepare and use LEQEMBI IQLIK.

Before each use of LEQEMBI IQLIK

Read this Instructions for Use before you start using LEQEMBI IQLIK and each time you get a refill. There may be new information. This information does not take the place of talking to your healthcare provider about your medical condition or your treatment.

Your healthcare provider should show you or a caregiver how to use LEQEMBI IQLIK the right way before you use it for the first time. If you have any questions about how to use the autoinjector, contact your healthcare provider.

Important information

- LEQEMBI IQLIK is only given as an injection under the skin (subcutaneous).
- **Do not** remove the clear cap until you are ready to inject.
- **Do not** try to take apart the autoinjector at any time.
- **Do not** reuse the autoinjector.
- **Do not** inject through clothing.
- **Do not** shake the autoinjector.
- **Do not** use the autoinjector if the carton or any parts look damaged or has been dropped.
- **Do not** hold the autoinjector by the magenta needle cover.

Storing LEQEMBI IQLIK

- Store the LEQEMBI IQLIK autoinjector in a refrigerator between 36°F to 46°F (2°C to 8°C).
- **Do not** freeze.
- Keep the LEQEMBI IQLIK autoinjector in the original package until ready to use, to protect it from light.
- LEQEMBI IQLIK may be stored at room temperature up to 77°F (25°C) for up to 14 days in the original package. **Do not** place it back in the refrigerator if it has been brought to room temperature.
- **Do not** shake LEQEMBI IQLIK.
- Throw away (dispose of) LEQEMBI IQLIK that is out of date, or if it is not stored the right way.
- Keep your LEQEMBI IQLIK autoinjector and all medicines out of the reach of children.

The LEQEMBI IQLIK autoinjector

Before use

After use

Gather Supplies

Included supplies

1 LEQEMBI IQLIK autoinjector

Supplies not included

Alcohol wipe

Cotton ball or gauze

Sharps container

Adhesive bandage

Preparing to Inject LEQEMBI IQLIK

Step 1

Remove carton from the refrigerator and **wait 20 minutes** for the autoinjector to reach room temperature. **Do not** try to speed up the warming process in any way because the product may be damaged.

Check the carton.

- **Do not** use if the expiration date on the carton has passed.
- **Do not** use if the seal on the carton is broken.

Step 2

Check the autoinjector.

- **Do not** use if the autoinjector is damaged or has been dropped.

Check viewing window.

- **Do not** use if the medicine looks cloudy, discolored, or contains particles. The medicine should be clear and colorless to pale yellow. It is normal to see air bubbles in the window.

Check the expiration date.

- **Do not** use if the expiration date on the autoinjector has passed.

Step 3

Wash your hands with soap and water or use hand sanitizer.

Step 4

You can inject into the front of your thighs or stomach area (abdomen). If a caregiver gives you the injection, they may also do it in the back of your upper arm.

- **Do not** inject into moles, scars, bruises, tattoos or into areas where the skin is red, hard, tender or injured.
- **Do not** inject into the 2-inch area around the belly button.

Injecting LEQEMBI IQLIK

Step 5

Clean the injection site with an alcohol wipe and allow the skin to air dry.

- **Do not** touch the injection site after it is cleaned.
- **Do not** fan or blow on the cleaned area.

Step 6

Remove the clear cap when you are ready to inject.

Hold the autoinjector with 1 hand and firmly pull the clear cap straight off with your other hand.

- **Do not** bend or twist the clear cap while pulling it off.
- **Do not** put your fingers or hand over the needle. Doing this may cause a needle injury.
- **Do not** put back the clear cap on after it has been removed from the autoinjector.

Step 7

Throw away (dispose of) the cap in the household trash or sharps disposal container.

Step 8

Place the magenta needle cover at a 90-degree angle flat against the skin. Make sure you can see the viewing window.

- **Do not** inject through clothing.

**Step 9**

Push the autoinjector firmly against the skin to start the injection.

The injection will start automatically.

- You may hear a first “click” which indicates the start of the injection.
- The purple plunger rod will move down in the viewing window during the injection.

If you have trouble hearing the click, watch the purple plunger rod as it moves down.

Step 10

Continue holding the autoinjector down against the skin for about **10 seconds**. You will hear a second click. The purple plunger rod will fill the viewing window.

Your injection is complete, but continue holding the autoinjector.

Step 11

Keep holding the autoinjector in place **for at least 5 more seconds** after the injection is complete.

Step 12

Remove the autoinjector by pulling it straight up from the injection site.

- The magenta needle cover will automatically move into place to cover the needle.

**Step 13**

You may notice a small drop of blood at the injection site. This is normal. Press a cotton ball or gauze on the area.

- If needed, cover the injection site with an adhesive bandage.
- **Do not** rub the injection site.

Step 14

Throw away (dispose of) the autoinjector in an FDA-cleared sharps disposal container.

**Disposing of LEQEMBI IQLIK**

Do not throw away (dispose of) the autoinjector in the household trash.

If you do not have an FDA-cleared sharps disposal container, you may use a household container that is:

- made of heavy-duty plastic,
- can be closed with a tight-fitting, puncture-resistant lid, without sharps being able to come out,
- upright and stable during use,
- leak-resistant, and
- properly labeled to warn of hazardous waste inside the container.

When your sharps disposal container is almost full, follow your community guidelines for the right way to throw away (dispose of) your sharps container. There may be state or local laws about how you should throw away used needles and syringes. For more information about safe sharps disposal, and for specific information about sharps disposal in the state that you live in, go to the FDA's website at: <http://www.fda.gov/safesharpsdisposal>.

Do not dispose of your used sharps disposal container in your household trash unless your community guidelines permit this.

Do not recycle your used sharps disposal container.
